Chapter 0

Introduction

E-mail: insuk.seo@snu.ac.kr, 27-212

Office Hour: Tuesday 15:00 - 16:00

Grading

- Mid-terms 1 (15%, 10/10 or 17)
- Mid-terms 2 (15%, 11/7)
- Final-term (40%)
- Assignment (20%, 8-10 times)
- Attendance (10%, absent: -2%, late: -1%)

Let X be a standard normal random variable in \mathbb{R} . i.e., $\mathbb{P}[X \in [a, b]] = \int_a^b \frac{1}{\sqrt{2\pi}} e^{-x^2/2} dx$.
(Central Limit Theorem) If $x_1, x_2, \dots, x_n \in X, E(x_i) = m, Var(x_i) = \sigma^2$, then

$$\frac{\frac{x_1-m}{\sigma} + \frac{x_2-m}{\sigma} + \dots + \frac{x_n-m}{\sigma}}{\sqrt{n}} \rightarrow X$$

In this class, we study dynamic version of this theorem. If $(W_t)_{t \geq 0}$ be a fluctuation, then $(W_t)_{t \geq 0}$ be a random variable in $C[0, T]$

Example. $\frac{dX_t}{dt} = rX_t; dX_1 = rX_t dt$. Then, $X_t = X_0 e^{rt}$ (unrisky assets, bank)

$dX_t = rX_t dt + \sigma X_t dW_t$, σ : volatility (risky assets, stock)

We will study:

1. Probability Space
2. Random Variable
3. Expectation

Textbooks:

1. Stochastic Calculus for Finance II (Shreve), covering chapter 1-3 or 4
2. Introduction to Stochastic Integration (Hui-Hsiung Kuo)

Chapter 1

General Probability Theory

1.1 Infinite Probability Spaces

There are three elements consisting probability space:

- S : Sample space
- \mathcal{E} : Family of events $\mathcal{E} \subseteq 2^S$ (σ -algebra in measure theory)
- \mathbb{P} : probability $\Rightarrow \mathbb{P}(E)$ is defined for all $E \in \mathcal{E}$ (μ with $\mu(S) = 1$)

Example.

1. Toss a coin twice (H for Head, T for Tail)
Then, $S = \{HH, HT, TT, TH\}$
2. Uniform random variable in $[0, 1]^3$
Then, $S = [0, 1]^3$. If $E = [0, \frac{1}{2}]^3$, then $\mathbb{P}(E) = \text{Vol}(E) = \frac{1}{8}$

How to define \mathcal{E} ?

In example 2, let $\mathcal{E} =$ family of all subsets of $[0, 1]^3$ naively. But Banach-Tarski Paradox says there are disjoint sets E, F with $\mathbb{P}(E \cup F) \neq \mathbb{P}(E) + \mathbb{P}(F)$ in this \mathcal{E} . Therefore we cannot naively set \mathcal{E} (Use measure theory)

In example 1, suppose that we cannot see the second flip. If $\{HH\} \notin \mathcal{E}$ and $\{HT, HH\} \in \mathcal{E}$, then $\mathcal{E} = \{\emptyset, \{HH, HT\}, \{TH, TT\}, \{HH, HT, TH, TT\}\}$

Definition 1.1.1 (Measure)

Let Ω be a non-empty set and \mathcal{F} be family of subsets of Ω with

1. $\emptyset \in \mathcal{F}$
2. $A \in \mathcal{F} \Rightarrow A^C \in \mathcal{F}$
3. $A_1, A_2, \dots \in \mathcal{F} \Rightarrow \bigcup_{i=1}^{\infty} A_i \in \mathcal{F}$.

We say \mathcal{F} as **σ -algebra** or **σ -field**, $A \in \mathcal{F}$ as **measurable**, and Ω as **measurable space**.

Exercises.

- 1) $\Omega \in \mathcal{F}$
- 2) $A_1, A_2, \dots \in \mathcal{F}$, then $A_1 \cap A_2 \dots \in \mathcal{F}$
- 3) $A_1, A_2, \dots \in \mathcal{F}$, then $A_1 \cup \dots \cup A_n, A_1 \cap \dots \cap A_n \in \mathcal{F}$.
- 4) $A, B \in \mathcal{F}$, then $A - B \in \mathcal{F}$

Definition 1.1.2 (Topological Space)

(See Rudin: *Real and Complex Analysis*, Chapter 1.) Let Θ be non-empty set and τ be family of subsets of Θ with

1. $\emptyset, \Theta \in \tau$
2. $V_1, \dots, V_n \in \tau \Rightarrow V_1 \cap \dots \cap V_n \in \tau$
3. $V_\alpha \in \tau \ \forall \alpha \in I \Rightarrow \bigcup_{\alpha \in I} V_\alpha \in \tau$.

We say $V \in \tau$ be an **open set**, and (Θ, τ) be a **topological space**.

Definition 1.1.3 (Measurable Function)

$f : (\Omega, \mathcal{F}) \rightarrow (\Theta, \tau)$ is **measurable** if $f^{-1}(V) \in \mathcal{F} \ \forall V \in \tau$

Definition 1.1.4 (Positive Measure)

Let Ω be non-empty set and \mathcal{F} be σ -algebra. Then $\mu : \mathcal{F} \rightarrow [0, \infty]$ is called **measurable** if

1. A_1, A_2, \dots : disjoint members of $\mathcal{F} \Rightarrow \mu(A_1 \cup A_2 \cup \dots) = \sum_{i=1}^{\infty} \mu(A_i)$
2. $\mu(A) < \infty$ for some $A \in \mathcal{F}$,

and $(\Omega, \mathcal{F}, \mu)$ is called a **measure space**.

Definition 1.1.5 (probability space, random variable)

1. $(\Omega, \mathcal{F}, \mathbb{P})$ is called a **probability space** if $\mathbb{P}(\Omega) = 1$.
2. X is called a **random variable** if it is a function from $(\Omega, \mathcal{F}, \mathbb{P})$ to \mathbb{R}

Next Class

- Borel sets on \mathbb{R} or \mathbb{R}^d
- Lebesgue Measure
- Lebesgue Integral (Define Expectation of random variable)

Last class, we define a sample space Ω , a σ -algebra \mathcal{F} , and a (positive) measure $\mu : \mathcal{F} \rightarrow [0, \infty]$.

Exercises.

- $A_1 \subseteq A_2 \subseteq \dots \Rightarrow \mu(\bigcup_{i=1}^{\infty} A_i) = \lim_{n \rightarrow \infty} \mu(A_n)$
- $A_1 \supseteq A_2 \supseteq \dots, \mu(A_1) < \infty \Rightarrow \mu(\bigcap_{i=1}^{\infty} A_i) = \lim_{n \rightarrow \infty} \mu(A_n)$

Theorem 1.1.6 (Rudin 1.10)

Let \mathcal{F}_0 be a collection of subset of Ω . Then, $\exists! \mathcal{F}^*$ minimal σ -algebra containing \mathcal{F}_0 .

Proof. Let $\{\mathcal{F}_\alpha, \alpha \in I\}$ be a family of σ -algebra containing \mathcal{F}_0 . Then, $\mathcal{F}^* = \bigcap_{\alpha \in I} \mathcal{F}_\alpha$ satisfies the three condition: 1) contain \mathcal{F}_0 2) σ -algebra 3) minimal (trivial, $\mathcal{F}^* \subseteq \mathcal{F}_\alpha$) \square

Definition 1.1.7 (Borel measurable)

\mathcal{B} is a **Borel σ -algebra** on the topological space (Θ, τ) if \mathcal{B} is a minimal σ -algebra containing τ , and B is a **Borel measurable** if $B \in \mathcal{B}$.

Remark (Completion of measure space, Rudin 1.15).

Consider an extension $(\Omega, \mathcal{F}, \mu) \rightarrow (\Omega, \overline{\mathcal{F}}, \mu)$ where

1. $\overline{\mathcal{F}} = \{A \cup N : A \in \mathcal{F}, N \subseteq A_0 \in \mathcal{F}, \mu(A_0) = 0\}$
2. $\mu(A \cup N) = \mu(A)$

Then, (Check!)

1. (well-definedness) $A_1 \cup N_1 = A_2 \cup N_2 \Rightarrow \mu(A_1) = \mu(A_2)$
2. $\mu : \overline{\mathcal{F}}$ is σ -algebra.
3. $\mu : \overline{\mathcal{F}} \rightarrow [0, \infty]$ is a measure

Example.

1) \mathbb{R}

$$\mathcal{F}_0 = \tau \xrightarrow{1.10} \mathcal{B} \xrightarrow{\text{completion}} \overline{\mathcal{B}}$$

$$\mathcal{L} \xrightarrow{\text{Rudin CH 2}} \mathcal{L} \xrightarrow{\text{completion}} \mathcal{L}$$

2) $C[0, T] = \Omega = \{f; f : [0, T] \rightarrow \mathbb{R}, \text{continuous}\}$.

Define $\mathcal{F}_0 = \{\bigcup_{t_1, t_2, \dots, t_k} (A_1, A_2, \dots, A_k) : 0 \leq t_1 < t_2 < \dots < t_k \leq T; A_1, \dots, A_k \in \overline{\mathcal{B}}\}$. We call $\{f \in C[0, T] : f(t_1) \in A_1, f(t_2) \in A_2, \dots, f(t_k) \in A_k\}$ as **cylindrical set**. Consider

$$\begin{array}{ccccc} \mathcal{F}_0 & \xrightarrow{1.10} & \mathcal{B} & \xrightarrow{\text{completion}} & \overline{\mathcal{B}} \\ \mathbb{P}_{\text{BM}} & \xrightarrow{\text{KET}} & \mathbb{P}_{\text{BM}} & \xrightarrow{\text{completion}} & \mathbb{P}_{\text{BM}}^* \end{array}$$

(KET refers Kolmogorov's Extension Thm)

1.2 Random Variables and Distributions

Definition 1.2.1

$f : \Omega \rightarrow \mathbb{R}$ is measurable if $f^{-1}(V) \in \mathcal{F}$ for any open set $V \subseteq \mathbb{R}$.

Remark. $\mathcal{B}(\mathbb{R})$ = Borel σ -algebra in \mathbb{R} .

Remark. If f is measurable, then $f^{-1}(B) \in \mathcal{F}$ for any $B \in \mathcal{B}(\mathbb{R})$.

Proof. Let $G = \{A \subseteq \mathbb{R} : f^{-1}(A) \in \mathcal{F}\}$. Then, $\tau \subseteq G$, G : σ -algebra (check!), hence $\mathcal{B}(\mathbb{R}) \subseteq G$. \square

Definition 1.2.2

- $(\Omega, \mathcal{F}, \mathbb{P})$ is a **probability space** if $\mathbb{P}(\Omega) = 1$.
- X is a **random variable** if $X : \Omega \rightarrow \mathbb{R}$ is measurable.

Example.

1. Toss a coin Twice.

$\Omega = \{HH, HT, TH, TT\}$, $\mathcal{F} = 2^\Omega = \{\text{all subsets of } \Omega\}$, $\mathbb{P}(A) = \frac{1}{4}|A|$, $A \in \mathcal{F}$.

Then, X = the number of H 's is a random variable with $X(HH) = 2$, $X(HT) = X(TH) = 1$, $X(TT) = 0$.

2. Uniform random variable in $[0, 1]$

$\Omega = [0, 1]$, $\mathcal{F} = \{B \in \mathcal{B}(\mathbb{R}) : B \subseteq [0, 1]\}$, $\mathbb{P}(B) = \mathcal{L}(B)$ ($\mathbb{P}([0, 1]) = \mathcal{L}([0, 1]) = 1$).

Then, $X : [0, 1] \rightarrow \mathbb{R}$ with $X(x) = x$ is a (uniform) random variable in $[0, 1]$.

Remark. \mathcal{L} : Lebesgue measure on \mathbb{R} . i.e., $\mathcal{L}(a, b) = b - a$. Then, $\mathcal{L}(\{a\}) = 0$

($\because \{a\} = \bigcap_{i=1}^{\infty} (a - \frac{1}{i}, a + \frac{1}{i}) \Rightarrow \mathcal{L}(\{a\}) = \lim_{n \rightarrow \infty} \mathcal{L}((a - \frac{1}{n}, a + \frac{1}{n})) = 0$)

Similarly, $\mathcal{L}([a, b]) = \mathcal{L}([a, b)) = \mathcal{L}((a, b]) = b - a$, $\mathcal{L}(\mathbb{Q}) = \sum_{q \in \mathbb{Q}} \mathcal{L}(\{q\}) = 0$.

Return to uniform random variable,

$$\mathbb{P}[X \in (a, b)] = \mathbb{P}[\{x : X(x) \in (a, b)\}] = \mathbb{P}[(a, b)] = b - a.$$

Definition 1.2.3 (Distribution measure on X)

X is a random variable in $(\Omega, \mathcal{F}, \mathbb{P})$. μ_X is a **distribution measure** on X if μ_X is a probability measure on $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ such that

$$\mu_X(B) = \mathbb{P}[X \in B] = \mathbb{P}[\{\omega : X(\omega) \in B\}] = \mathbb{P}[X^{-1}(B)] \quad \forall B \in \mathcal{B}(\mathbb{R})$$

Definition 1.2.4 (Probability density function)

f is a **probability density function** of X if $\mu_X((a, b)) = \int_a^b f(x) dx$

Remark. There is a measure with no pdf: Dirac measure

Remark. Lebesgue-Radon-Nikodym decomposition implies that any measure can be decomposed as density part and singular part.

Example (Standard Normal random variable).

Let $\phi(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$. Define $F : (0,1) \rightarrow \mathbb{R}$ by $F(x) = N^{-1}(x)$ for $N(X) = \int_{-\infty}^x \phi(y)dy$. Let $\Omega = (0,1)$, $\mathcal{F} = \{B \in \mathcal{B}(\mathbb{R}) : B \subseteq (0,1)\}$, $\mathbb{P}(A) = \mathcal{L}(A) : A \in \mathcal{B}(\mathbb{R})$.

Then, $Y : \Omega \ni x \mapsto F(x) \in \mathbb{R}$ is a random variable with

$$\begin{aligned}\mathbb{P}[Y \in (a,b)] &= \mathbb{P}[\{x : Y(x) \in (a,b)\}] \\ &= \mathbb{P}[\{x \in (N(a), N(b))\}] \\ &= N(b) - N(a) = \int_a^b \phi(x)dx,\end{aligned}$$

and a density function is ϕ .

Previous Question: In the probability space $(\Omega, \mathcal{F}, \mathbb{P})$ and random variable $X : \Omega \rightarrow \mathbb{R}$, the random element or random realization $\omega \in \Omega$ is a element of events in sample space. For example, $\omega = HHTTH$ is a random element in tossing a coin five times, and $X(\omega) = 3$. ($X(\omega) = \#$ of Heads)

In the previous example(Standard Normal random variable), define $(\Omega, \mathcal{F}, \mathbb{P}) = ((0,1), \mathcal{B}(0,1), \mathbb{P})$, $\mathbb{P}((a,b)) = b - a$, $F(x) = \int_{-\infty}^x \frac{1}{\sqrt{2\pi}}e^{-y^2/2}dy$, $X : (0,1) \ni \omega \mapsto F^{-1}(\omega) \in \mathbb{R}$. Then, X is called a standard normal random variable.

1.3 Expectations

In the following, let $\Omega = (\Omega, \mathcal{F}, \mathbb{P})$. Let $X : \Omega \rightarrow \mathbb{R}$. Then the expectation $\mathbb{E}(X)$ is a mean of $X(\omega)$ with respect to the randomness of ω (given by \mathbb{P})

Definition 1.3.1 (Lebesgue Integration)

$(\Omega, \mathcal{F}, \mu)$ is a measure space, and $f : \Omega \rightarrow \mathbb{R}$ is a measurable function.

(1) $f : \Omega \rightarrow [0, \infty)$

Let $0 = y_0 < y_1 < y_2 < \dots \rightarrow \mathbb{R}$ be a partition of $[0, \infty)$,

$\Pi = \{y_0, y_1, y_2, \dots\} : \|\Pi\| = \sup_{i \geq 1} |y_i - y_{i-1}|$, and

$LS_\Pi = \sum_{i=0}^{\infty} y_i \mu[f^{-1}([y_i, y_{i+1}))]$.

In Rudin's book, $\lim_{\|\Pi\| \rightarrow 0} LS_\Pi$ converges to an element belonging to $[0, \infty]$.

Now, $\int f d\mu := \lim_{\|\Pi\| \rightarrow 0} LS_\Pi$ is called a **Lebesgue Integral**.

(2) $f : \Omega \rightarrow \mathbb{R}$

Let $f^+ = \max\{f, 0\} \geq 0$, and $f^- = -\min\{f, 0\} \geq 0$. Then, $f = f^+ - f^-$, and

$|f| = f^+ + f^-$. If $\int f^+ d\mu < \infty$ and $\int f^- d\mu < \infty$, then we say f is Lebesgue

integrable and $f \in L^1(\mu)$. The Lebesgue integral of $f = \int f d\mu$ is defined as

$\int f^+ d\mu - \int f^- d\mu$

Remark.

1. $\int f^+ d\mu < \infty$ and $\int f^- d\mu = \infty$, then $\int f d\mu = -\infty$. The others are defined similarly.
2. $f \in L^1(\mu) \Leftrightarrow \int |f| d\mu < \infty$.

Example (Riemann vs Lebesgue Integral (p19-22)).

- $(\mathbb{R}, \mathcal{B}(\mathbb{R}), \mathcal{L})$ Lebesgue measure where $\mathcal{L}((a, b)) = b - a$.
- $f : \mathbb{R} \rightarrow \mathbb{R} \in L^1(\mathcal{L})$
- (Def) $A \subseteq \mathbb{R}$, $\int_A f d\mu := \int f \mathbb{1}_A d\mu$, where $\mathbb{1}_A(x) = 1$ if $x \in A$, and 0 otherwise.

If f is Riemann integrable, then $\int_{[a,b]} f d\mathcal{L} = \int_a^b f dx$.

Riemann integral is a limit of approximation by a partition of x -axis. On the other hand, Lebesgue integral is a limit of approximation by a partition of y -axis with preimage. Partition of x -axis is sensitive to fluctuation and restricted to Euclidean space, while partition of y -axis is not. For example, $f(x) = \mathbb{1}_{\mathbb{Q}}(x)$ is Lebesgue integrable, but it is not Riemann integrable since it is sensitive to fluctuation.

Definition 1.3.2 (Almost everywhere, 1.1.5 in Textbook)

$P(x)$ is a property at $x \in \mathbb{R}$. We say P holds **almost everywhere** (or a.e.) in \mathbb{R} if and only if $\mathcal{L}(\{x : P(x) \text{ does not hold}\}) = 0$.

Example. $f(x) = [x]$ is continuous almost everywhere.

Theorem 1.3.3

f is Riemann integrable if and only if f is continuous a.e.

Exercises. $f = g$ a.e. $\Rightarrow \int f d\mathcal{L} = \int g d\mathcal{L}$.

Definition 1.3.4 (Almost surely)

Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space. The event $A(\in \mathcal{F})$ occurs **almost surely** (a.s.) if $\mathbb{P}(A) = 1$.

Example. Let X be a uniform random variable in $(0, 1)$. Let $A = \{X(\omega) \neq \frac{1}{2}\}$; $\mathbb{P}(A) = 1$.

Definition 1.3.5 (Expectation, 1.3.3. in Textbook)

Expectation of $X : \Omega \rightarrow \mathbb{R}$ is defined by

$$\mathbb{E}(X) := \int_{\Omega} X d\mathbb{P} \quad \text{if} \quad \int_{\Omega} |X| d\mathbb{P} < \infty$$

Theorem 1.3.6 (1.3.4 in Textbook)

1. X takes finite number of values $\{x_1, x_2, \dots, x_n\} \Rightarrow \mathbb{E}(X) = \sum_{i=1}^n x_i \mathbb{P}(X = x_i)$

2. X, Y : random variables, $E(|X|), E(|Y|) < \infty$,

(i) $X \leq Y$ a.s. (i.e. $\mathbb{P}[\{X(\omega) \leq Y(\omega)\}] = 1$), then $\mathbb{E}(X) \leq \mathbb{E}(Y)$

(ii) $X = Y$ a.s. $\Rightarrow \mathbb{E}(X) = \mathbb{E}(Y)$

3. X, Y : random variables, $\mathbb{E}(|X|), \mathbb{E}(|Y|) < \infty \Rightarrow \mathbb{E}(\alpha X + \beta Y) = \alpha \mathbb{E}(X) + \beta \mathbb{E}(Y)$.

4. Jensen's Inequality: $\phi : \mathbb{R} \rightarrow \mathbb{R}$ is a convex function $\Rightarrow \phi(\mathbb{E}(X)) \leq \mathbb{E}(\phi(X))$

(c.f. $\phi(t) = t^2$)

Proof of 4. Define $S_\phi = \{(a, b) \in \mathbb{R}^2 : a + bt \leq \phi(t) \ \forall t\}$. Then $\forall t \in \mathbb{R}, \phi(t) = \sup_{(a,b) \in S_\phi} \{a + bt\}$. In fact, it is a equivalent condition. Now,

$$\begin{aligned} \phi(\mathbb{E}[X]) &= \sup_{a,b \in S_\phi} \{a + b\mathbb{E}[X]\} \\ &= \sup_{a,b \in S_\phi} \mathbb{E}[a + bX] \\ &\leq \mathbb{E}[\sup_{a,b \in S_\phi} (a + bx)] = \mathbb{E}[\phi(X)] \quad (\text{Check!}) \end{aligned}$$

□

Example (Dirac Measure in \mathbb{R}). $(\mathbb{R}, \mathcal{B}(\mathbb{R}), \delta_y)$ ($y \in \mathbb{R}$) is a probability space with $\delta_y(A) = 1$ if $y \in A$, and 0 otherwise. Then, $\int_{\mathbb{R}} f d\delta_y = f(y)$ (Check!)

Consider modeling: X : random variable such that probability of $x_i = p_i$ with $\sum_{i=1}^n p_i = 1$. Then, $(\mathbb{R}, \mathcal{B}(\mathbb{R}), \mu)$ with $\mu = \sum_{i=1}^n p_i \delta_{x_i}$ is a probability space, and $P(X = x_i) = p_i$ for $X : \mathbb{R} \ni \omega \mapsto \omega \in \mathbb{R}$: Example of thm 1.3.4.

Summary:

- Probability space: $(\Omega, \mathcal{F}, \mathbb{P})$
- Random variables: $X : \Omega \rightarrow \mathbb{R}$
- Expectation: $E(X) = \int X d\mathbb{P}$

1.4 Convention of Integrals

We will use this section when we define the Brownian motion.

Definition 1.4.1

(1) Let $(\Omega, \mathcal{F}, \mu)$ be a measure space, and f, f_1, f_2, \dots be measurable $(\Omega \rightarrow \mathbb{R})$. Then, $f_n \rightarrow f$ **almost everywhere** (a.e.) if

$$\mu[\{\omega : (f_n(\omega))_{n=1}^\infty \text{ does not converge to } f(\omega)\}] = 0$$

- (2) Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space, X, X_1, X_2, \dots be random variables. Then, $X_n \rightarrow X$ **almost surely** (a.s.) if

$$\mathbb{P}[\{\omega : (X_n(\omega))_{n=1}^{\infty} \text{ does not converge to } X(\omega)\}] = 0$$

Question: $f_n \rightarrow$ a.e. Then, $\int f_n d\mu \rightarrow \int f d\mu$? $X_n \rightarrow X$ a.s. Then, $\mathbb{E}[X_n] \rightarrow \mathbb{E}[X]$?

Theorem 1.4.2 (Monotone Convergence Theorem. 1.4.5 in Textbook)

$0 \leq f_1 \leq f_2 \leq \dots$ (or decreasing), and $f_n \rightarrow f$ a.e. Then, $\int f_n d\mu \rightarrow \int f d\mu$.

Theorem 1.4.3 (Dominated Convergence Theorem. 1.4.9 in Textbook)

$\exists g \in L^1(\mu)$ such that $|f_n| \leq g$ for all n , and $f_n \rightarrow f$ a.e. Then, $\int f_n d\mu \rightarrow \int f d\mu$.

Corollary 1.4.4

$\exists Y \in L^1(\mathbb{P})$ such that $|X_n| \leq Y$ for all n , and $X_n \rightarrow X$ a.s. Then, $\mathbb{E}[X_n] \rightarrow \mathbb{E}[X]$.

Example. Let $f_n(x) = \begin{cases} n^2 x & \text{if } 0 \leq x \leq \frac{1}{n}, \\ -n^2 x + n & \text{if } \frac{1}{n} < x \leq \frac{2}{n}, \\ 0 & \text{otherwise.} \end{cases}$ Then, $f_n \rightarrow 0$ a.e. and $\int f_n dx = 1$.

1.5 Computation of Expectations

Notation: $(X : \Omega \ni \omega \mapsto X(\omega) \in \mathbb{R})$

- $\mathbb{E}[X] = \int X d\mathbb{P} = \int_{\Omega} X(\omega) d\mathbb{P}(\omega)$
- $\int_B X(\omega) d\mathbb{P}(\omega) := \int \mathbb{1}_B(\omega) X(\omega) d\mathbb{P}(\omega)$

Recall: X : random variable, μ_X : distribution measure on $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$, $\mu_X(B) = \mathbb{P}(X \in B)$.

Theorem 1.5.1

$g \in L^1(\mu_X)$. Then, $\mathbb{E}[g(X)] = \int_{\mathbb{R}} g(x) d\mu_X(x) := \int g d\mu_X$.

Example. $g(x) = x$. $\int |x| d\mu_X(x) < \infty \Rightarrow \mathbb{E}[X] = \int x d\mu_X(x)$.

Proof. First, prove the thm holds for $g \geq 0$, then prove for general g by $g = g^+ - g^-$.

- (1) $g = \mathbb{1}_B$

By thm 1.3.4. (1), $\mathbb{E}[\mathbb{1}_B(X)] = 1 \cdot \mathbb{P}[\mathbb{1}_B(X) = 1] = \mathbb{P}(X \in B) = \mu_X(B) = \int \mathbb{1}_B(x) d\mu_X(x)$.

- (2) $g = \sum_{k=1}^n \alpha_k \mathbb{1}_{B_k}$

Trivial by linearity.

- (3) $g \geq 0$

By MCT. See *Rudin* chapter 1 for details.

□

Recall: X : random variable, X has density function f_X if

$$\mu_X((a, b)) = \int_a^b f_X(x) dx \quad \forall a, b.$$

$$\mu_X(B) = \int_B f_X d\mathcal{L} = \int_B f_X(x) d\mathcal{L}(x) = \int_B f_X(x) dx.$$

Theorem 1.5.2

$g \in L^1(\mu_X)$. Then, $E(g(X)) = \int_{\mathbb{R}} g(x) f_X(x) dx$.

Example. Let X be standard normal. i.e., $f_X(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}$ (regardless what X be). Then,
 $E(X^4) = \int_{\mathbb{R}} x^4 \frac{1}{\sqrt{2\pi}} e^{-x^2/2} = 3$.

Chapter 2

Information and Conditioning

2.1 Information and σ -algebras

Example. Toss a coin Three times. $\Omega = \{HHH, HHT, \dots, TTT\}$.

$A_H = \{HHH, HHT, HTH, HTT\}$, $A_T = \{THT, THT, TTH, TTT\}$.

Let $\mathcal{F}(1) = \{\phi, \Omega, A_H, A_T\}$ so that it is a σ -algebra containing the randomness up to time 1.

Similarly, define $A_{HH}, A_{HT}, A_{TH}, A_{TT}$.

Let $\mathcal{F}(2) = \{\phi, \Omega, A_{HH}, A_{HT}, A_{TH}, A_{TT}, A_{HH} \cup A_{HT}, \dots, A_{TT}^C\}$ so that it is a σ -algebra containing the randomness up to time 2, and define $\mathcal{F}(0)$ similarly, and let $\mathcal{F}(0) = \{\phi, \Omega\}$.

Then, $\mathcal{F}(0) \subseteq \mathcal{F}(1) \subseteq \mathcal{F}(2) \subseteq \mathcal{F}(3)$. Let $X_t = \#$ of heads until time t . Then, X_t is $\mathcal{F}(t)$ -measurable. for each t .

Now, $\{X_1 = 1\} = \{\omega : X_1(\omega) = 1\} = A_H$, and $\{X_1 = 0\} = \{\omega : X_1(\omega) = 0\} = A_T$.

Definition 2.1.1 (σ -algebra generated by X)

Ω is a set, $X : \Omega \rightarrow \mathbb{R}$. $\sigma(X) = \{A \subseteq \Omega : A = X^{-1}(B) \text{ for some } B \in \mathcal{B}(\mathbb{R})\}$. Then, $\sigma(X)$ is a σ -algebra(exercise) and it is called a **σ -algebra generated by X** .

Remark. X is a random variable in $(\Omega, \sigma(X))$.

X is a random variable in (Ω, \mathcal{F}) , then $\sigma(X) \subseteq \mathcal{F}$ (exercise)

Definition 2.1.2 (\mathcal{F} -measurable)

(Ω, \mathcal{F}) : measure space. $X : \Omega \rightarrow \mathbb{R}$. X is called **\mathcal{F} -measurable** if $\sigma(X) \subseteq \mathcal{F}$. i.e., X : measurable with respect to (Ω, \mathcal{F}) .

In example, $X(t)$ is $\mathcal{F}(t)$ -measurable $\forall t$ (check!)

cf. $X(t) : \Omega \rightarrow \mathbb{R}$. $(X(t))^{-1}(B) \in \mathcal{F}(t) \quad \forall B \in \mathcal{B}(\mathbb{R})$.

Enough to check $(X(t))^{-1}(\{0\}), (X(t))^{-1}(\{1\}), \dots, (X(t))^{-1}(\{t\})$.

$\mathcal{F}(t)$ has enough information to determine $X(t)$ in the sense that $\{\omega : (X(t))(\omega) \in B\} \in \mathcal{F}(t) \quad \forall B \in \mathcal{B}(\mathbb{R})$.

Definition 2.1.3 (Filtration, Stochastic Process)

Ω : non-empty set, $T > 0$.

1. If $\mathcal{F}(t)$ is a σ -algebra $\forall t \in [0, T] \in T$ and $s < t \Rightarrow \mathcal{F}(s) \subseteq \mathcal{F}(t)$, then $(\mathcal{F}(t) : t \in [0, T])$ is called a **filtration**
2. If $X(t) : \Omega \rightarrow \mathbb{R}$ is $\mathcal{F}(t)$ -measurable $\forall t \in [0, T]$, then $(X(t) : t \in [0, T])$ is called **Stochastic Process adopted to the filtration $\mathcal{F}(t)$** .

2.2 Independence

$X : \Omega \rightarrow \mathbb{R}$, \mathcal{F} : σ -algebra on Ω .

1. \mathcal{F} has full information to determine $X \Rightarrow X$ is \mathcal{F} -measurable. (2.1)
2. \mathcal{F} has no information to determine $X \Rightarrow X$ is independent to \mathcal{F} . (2.2)
3. \mathcal{F} has a partition information to determine $X \Rightarrow$ (2.3)

Definition 2.2.1 (independent)

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space. $A, B \in \mathcal{F}$ is **independent** if $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$.

Question: X, Y are random variables in $(\Omega, \mathcal{F}, \mathbb{P})$. If X, Y are independent, then $\mathbb{E}(XY) = \mathbb{E}(X)\mathbb{E}(Y)$, but the converse does not hold.

Definition 2.2.2

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space. $\mathcal{G}, \mathcal{H} \subseteq \mathcal{F}$ are sub σ -algebras of \mathcal{F} . $X, Y : \Omega \rightarrow \mathbb{R}$ are random variables in $(\Omega, \mathcal{F}, \mathbb{P})$.

1. \mathcal{G}, \mathcal{H} : independent iff $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B) \quad \forall A \in \mathcal{G}, B \in \mathcal{H}$.
2. X, Y : independent iff $\sigma(X), \sigma(Y)$ are independent.
3. X, \mathcal{G} : independent iff $\sigma(X), \mathcal{G}$ are independent.

Definition 2.2.3

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space.

$\mathcal{G}_1, \mathcal{G}_2, \dots, \mathcal{G}_n, \dots$: sub σ -algebra of \mathcal{F} . $X_1, X_2, \dots, X_n, \dots$: random variable in $(\Omega, \mathcal{F}, \mathbb{P})$.

1. $\mathcal{G}_1, \dots, \mathcal{G}_n$ are independent iff $\mathbb{P}(A_1 \cap \dots \cap A_n) = \mathbb{P}(A_1) \dots \mathbb{P}(A_n)$ for $A_1 \in \mathcal{G}_1, \dots, A_n \in \mathcal{G}_n$.
2. X_1, \dots, X_n are independent iff $\sigma(X_1) \sim \sigma(X_n)$ are independent.
3. $\mathcal{G}_1, \mathcal{G}_2, \dots$ are independent iff $\mathcal{G}_1 \sim \mathcal{G}_n$ are independent $\forall n$.

4. X_1, X_2, \dots are independent iff $X_1 \sim X_n$ are independent $\forall n$.

Example. Toss a coin three times.

1. $X(2), X(3)$ are not independent.

$$\mathbb{P}(\{X(2) = 2\} \cap \{X(3) = 1\}) \neq \mathbb{P}(X(2) = 2)\mathbb{P}(X(3) = 1).$$

2. $X(2), X(3) - X(2)$ are independent.

Why: $X(2)$ is an information at tossing first, second times, and $X(3)$ is an information at tossing third time.

Definition 2.2.4 (Joint distribution)

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space. X, Y are random variables in Ω . $(X, Y) : \Omega \ni \omega \mapsto (X(\omega), Y(\omega)) \in \mathbb{R}^2$

1. Joint Distribution Measure in \mathbb{R}^2

$$\mu_{X,Y}(C) = \mathbb{P}((X, Y) \in C) \text{ for } C \in \mathcal{B}(\mathbb{R}^2).$$

(Note: We checked that $\{\omega : (X(\omega), Y(\omega)) \in C\} \in \mathcal{F}$ in real analysis.)

2. Joint Cumulative Distribution Function

$$F_{X,Y}(a, b) = \mathbb{P}(X \leq a, Y \leq b) = \mu_{X,Y}((-\infty, a] \times (-\infty, b]) \text{ (check!)}$$

3. Joint Probability Distribution Function

If $f_{X,Y} : \mathbb{R}^2 \rightarrow \mathbb{R}$ is Borel-measurable and satisfies $\mu_{X,Y}(A \times B) = \int_B \int_A f_{X,Y}(x, y) dx dy$ for all $A, B \in \mathcal{B}(\mathbb{R})$, then $f_{X,Y}$ is called a joint probability density function (jpdf)

Theorem 2.2.5

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space, X, Y are random variables in Ω . Then, the followings are equivalent.

(i) X, Y are independent

$$(ii) \mu_{X,Y}(A \times B) = \mu_X(A)\mu_Y(B) \quad \forall A, B \in \mathcal{B}(\mathbb{R})$$

$$(iii) F_{X,Y}(a, b) = F_X(a)F_Y(b) \quad \forall a, b \in \mathbb{R}$$

$$(iv) \mathbb{E}[e^{uX+vY}] = \mathbb{E}[e^{uX}]\mathbb{E}[e^{vY}]$$

Remark. If JPDF $f_{X,Y}$ exists, then (i) to (iv) $\Leftrightarrow f_{X,Y}(x, y) = f_X(x)f_Y(y)$ a.e.

Theorem 2.2.6

X, Y are independent if and only if $f, g : \mathbb{R} \rightarrow \mathbb{R}$ Borel-measurable, $\mathbb{E}[|f(X)g(Y)|] < \infty$ implies that $\mathbb{E}[f(X)g(Y)] = \mathbb{E}[f(X)]\mathbb{E}[g(Y)]$.

Remark. $f(x) = g(x) = x : \mathbb{E}[|XY|] < \infty \Rightarrow \mathbb{E}[XY] = \mathbb{E}[X]\mathbb{E}[Y]$

Proof. Details are exercises.

$$(1) f = \mathbb{1}_A, g = \mathbb{1}_B$$

(2) f, g are simple functions

$$(3) f, g \geq 0$$

(4) f, g are general.

□

Review

\mathcal{G}, \mathcal{H} are independent if $\forall A \in \mathcal{G}, B \in \mathcal{H} \Rightarrow \mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$.

X, Y are independent if $\sigma(X), \sigma(Y)$ are independent.

* $\sigma(X) = \{A \in \Omega : A = X^{-1}(B) \text{ for some } B \in \mathcal{B}(\mathbb{R})\}$.

* $\mu_{X,Y}(C) = \mathbb{P}((X, Y) \in C) \quad \forall C \in \mathcal{B}(\mathbb{R}^2)$.

Thm. T.F.A.E.C:

1. X, Y are independent
2. $\mu_{X,Y}(A \times B) = \mu_X(A)\mu_Y(B)$
3. $\mathcal{F}_{X,Y}(x, y) = \mathcal{F}_X(x)\mathcal{F}_Y(y)$
4. (If JPDP $f_{X,Y}$ exists) $f_{X,Y}(x, y) = f_X(x)f_Y(y)$

Theorem 2.2.7

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space. X, Y are independent random variables, $f, g : \mathbb{R} \rightarrow \mathbb{R}$ are Borel measurable. Then, $f(X), g(Y)$ are independent.

Proof. $A \in \sigma(f(X))$; $A = (f \circ X)^{-1}(B)$ for some $B \in \mathbb{R} = X^{-1}(f^{-1}(B)) \in \sigma(X)$.

$\therefore \sigma(f(X)) \subseteq \sigma(X), \sigma(g(Y)) \subseteq \sigma(Y) \Rightarrow \sigma(f(X)), \sigma(g(Y))$ are independent. □

Corollary 2.2.8

$$\mathbb{E}[f(X)g(Y)] = \mathbb{E}[f(X)]\mathbb{E}[g(Y)].$$

Definition 2.2.9

X, Y are random variables in $(\Omega, \mathcal{F}, \mathbb{P})$.

1. $Var(X) = \mathbb{E}[(X - \mathbb{E}[X])^2] = \mathbb{E}[X^2] - \mathbb{E}[X]^2$
2. $std(X) = \sqrt{Var(X)}$
3. $Cov(X, Y) = \mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]$
4. $corr(X, Y) = cov(X, Y) / (std(X)std(Y))$

Example.

- X : standard normal random variable ($N(0, 1^2)$)
- $\mathbb{P}(Z = 1) = \mathbb{P}(Z = -1) = \frac{1}{2}$ (X, Z are independent)
- $Y = XZ$. Then
 - 1) Y is standard normal,
 - 2) $\text{corr}(X, Y) = 0$.
 - 3) X, Y are not independent.

Definition 2.2.10 (Jointly normal)

X, Y are **jointly normal** with mean $m = (m_X, m_Y)$, $\text{Var}(C) = \begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix}$ if

$$f_{X,Y}(z) = \frac{1}{\sqrt{(2\pi)^2 \det C}} e^{-\frac{1}{2}(z-m)C^{-1}(z-m)^T}$$

Theorem 2.2.11

X, Y are jointly normal and uncorrelated ($C_{12} = C_{21} = 0$). Then, they are independent.

2.3 Conditional Expectation

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space. $\int_A X d\mathbb{P} := \int \mathbb{1}_A X d\mathbb{P} = \int \mathbb{1}_A(\omega) X(\omega) d\mathbb{P}(\omega)$.

Lemma. $\int_A X d\mathbb{P} = \int_A Y d\mathbb{P}$ for all $A \in \mathcal{F}$ if and only if $X = Y$ a.s.

Proof. $A_n = \{\omega : X(\omega) - Y(\omega) > \frac{1}{n}\}, B_n = \{\omega : X(\omega) - Y(\omega) < -\frac{1}{n}\}$. Then,

$$0 = \int_{A_n} (X - Y) d\mathbb{P} \geq \int_{A_n} \frac{1}{n} d\mathbb{P} = \frac{1}{n} \int \mathbb{1}_{A_n} d\mathbb{P} = \frac{1}{n} \mathbb{P}(A_n)$$

Thus, $\mathbb{P}(A_n) = 0 \ \forall n$. Similarly, $\mathbb{P}(B_n) = 0$. Now, $\{\omega : X(\omega) \neq Y(\omega)\} = (\bigcup_{n=1}^{\infty} A_n) \cup (\bigcup_{n=1}^{\infty} B_n) \Rightarrow \text{measure } 0$. \square

Intuition. $(\Omega, \mathcal{F}, \mathbb{P})$ is given, $X : \mathcal{F}$ -measurable random variable, $\mathcal{G} \subseteq \mathcal{F}$ is a sub σ -algebra. If we know nothing, then we expect X as $\mathbb{E}[X]$. If we know \mathcal{F} , then we expect X as X . Now, if we know \mathcal{G} , then we expect X as $\mathbb{E}[X|\mathcal{G}]$ (what is it?)

Definition 2.3.1 (Conditional Expectation)

$(\Omega, \mathcal{F}, \mathbb{P})$ is a probability space. $X \in L^1(\mathbb{P})$ is a random variable. \mathcal{G} is a sub σ -algebra of \mathcal{F} . We define $\mathbb{E}[X|\mathcal{G}]$ as

1. \mathcal{G} -measurable random variable
2. $\int_A \mathbb{E}[X|\mathcal{G}](\omega) d\mathbb{P}(\omega) = \int_A X(\omega) d\mathbb{P}(\omega)$.

Question. $\mathbb{E}[X|\mathcal{G}]$ exists? (Yes! proof skip). unique? (Yes! up to a.s.)

Remark. Lemma implies determine X (a.s.) is equivalent to know $\int_A X d\mathbb{P} \quad \forall A \in \mathcal{F}$.

In this sense, conditional expectation $Y = \mathbb{E}[X|\mathcal{G}]$ is knowing $\int_A Y d\mathbb{P} = \int_A X d\mathbb{P} \quad \forall A \in \mathcal{G}$.

Example. Toss a coin three times.

$\mathcal{F}(0) \subseteq \mathcal{F}(1) \subseteq \mathcal{F}(2) \subseteq \mathcal{F}(3)$. $X(t)$ is a number of heads until t times; $X(t)$ is $\mathcal{F}(t)$ -measurable. If $\mathcal{F}(1) = \{\phi, \Omega, A_H, A_T\}$, then $\mathbb{E}[X(2)|\mathcal{F}(1)] = X(1) + \frac{1}{2}$, since we know the information of 1st flip.

Proof. Want: $\int_A (X(1) + \frac{1}{2}) d\mathbb{P} = \int_A X(2) d\mathbb{P}$ for all $A \in \mathcal{F}(1)$ (c.f $\mathbb{P}(\omega) = \frac{1}{8} \quad \forall \omega \in \Omega$).
For $A = A_H$, $\int \mathbb{1}_{A_H}(\omega) d\mathbb{P}(\omega) = (X(1)(\omega) + \frac{1}{2}) d\mathbb{P}(\omega) = \frac{3}{2} \mathbb{P}(A_H) = \frac{3}{4}$.
 $\int \mathbb{1}_{A_H}(\omega) (X(2))(\omega) d\mathbb{P}(\omega) = \sum_{\omega \in A_H} (X(2))(\omega) \mathbb{P}(\omega) = \frac{1}{8}(2 + 2 + 1 + 1) = \frac{3}{4}$

□

Remark. $\mathcal{G} = \sigma(Y)$; $\mathbb{E}[X|\mathcal{G}] = \mathbb{E}[X|\sigma(Y)] := \mathbb{E}[X|Y]$

Theorem 2.3.2

X, Y are independent random variable in $(\Omega, \mathcal{F}, \mathbb{P})$, \mathcal{G} is a sub σ -algebra of \mathcal{F} .

1. $\mathbb{E}[aX + bY|\mathcal{G}] = a\mathbb{E}[X|\mathcal{G}] + b\mathbb{E}[Y|\mathcal{G}]$
2. X is \mathcal{G} -measurable. Then, $\mathbb{E}[XY|\mathcal{G}] = X\mathbb{E}[Y|\mathcal{G}]$.
3. \mathcal{H} is a sub σ -algebra of \mathcal{G} . Then, $\mathbb{E}[\mathbb{E}[X|\mathcal{G}]|\mathcal{H}] = \mathbb{E}[X|\mathcal{H}]$.
4. X, \mathcal{G} are independent, then $\mathbb{E}[X|\mathcal{G}] = \mathbb{E}[X]$.

Proof. 1. Exercise

2. We only need to show that $X \geq 0, Y \geq 0$ implies 2.

(a) $X = \mathbb{1}_B$

Want: $\mathbb{E}[\mathbb{1}_B Y|\mathcal{G}] = \mathbb{1}_B \mathbb{E}[Y|\mathcal{G}]$ for $B \in \mathcal{G}$.

(b) $X = \sum_{i=1}^n \alpha_i + i \mathbb{1}_{B_i}$

Use linearity.

(c) $X \geq 0$

Use MCT

3. Want: $\mathbb{E}[\mathbb{E}[X|\mathcal{G}]|\mathcal{H}] = \mathbb{E}[X|\mathcal{H}]$

Let $A \in \mathcal{H}$. Then, $\int_A \mathbb{E}[\mathbb{E}[X|\mathcal{G}]|\mathcal{H}](\omega) d\mathbb{P}(\omega) = \int_A \mathbb{E}[X|\mathcal{G}] d\mathbb{P} = \int_A X d\mathbb{P} = \int_A \mathbb{E}[X|\mathcal{H}] d\mathbb{P}$

4. Can be shown similarly as in 2. Check $X = \mathbb{1}_B$ case. (Hint: $A \in \mathcal{G} \Rightarrow A, B$ are independent.)

□

Example (Revisit).

$$\begin{aligned}\mathbb{E}[X(2)|\mathcal{F}(1)] &= \mathbb{E}[X(2) - X(1) + X(1)|\mathcal{F}(1)] \\ &= \mathbb{E}[X(2) - X(1)|\mathcal{F}(1)] + X(1) \\ &= \mathbb{E}[X(2) - X(1)] + X(1) \\ &= \frac{1}{2} + X(1)\end{aligned}$$
