## Introduction

E-mail: *insuk.seo@snu.ac.kr*, 27-212 Grading

- Mid-terms 1 (15%, 10/10 or 17)
- Mid-terms 2 (15%, 11/7)
- Fianl-term (40%)
- Assignment (20%, 8-10 times)
- Attendance (10%, absent: -2%, late: -1%)

Let X be a standard normal random variable in  $\mathbb{R}$ . i.e.,  $\mathbb{P}[X \in [a,b]] = \int_a^b \frac{1}{\sqrt{2\pi}} e^{-x^2/2} dx$ . (Central Limit Theorem) If  $x_1, x_2, \dots, x_n \in X$ ,  $E(x_i) = m$ ,  $Var(x_i) = \sigma^2$ , then

$$\frac{\frac{x_1-m}{\sigma} + \frac{x_2-m}{\sigma} + \dots + \frac{x_n-m}{\sigma}}{\sqrt{n}} \to X$$

In this class, we study dynamic version of this theorem. If  $(W_t)_{t\geq 0}$  be a fluctuation, then  $(W_t)_{t\geq 0}$  be a random variable in C[0,T]

*Example.*  $\frac{dX_t}{dt} = rX_t; dX_1 = rX_t dt$ . Then,  $X_t = X_0 e^{rt}$  (unrisky assets, bank)  $dX_t = rX_t dt + \sigma X_t dW_t$ ,  $\sigma$ : volatility (risky assets, stock)

We will study:

- 1. Probability Space
- 2. Random Variable
- 3. Expectation

Textbooks:

- 1. Stochastic Calculus for Finance II (Shreve), covering chapter 1-3 or 4
- 2. Introduction to Stochastic Integration (Hui-Hsiung Kuo)

# Chapter 1

# **General Probability Theory**

### 1.1 Infinite Probability Spaces

There are three elements consisting probability space:

- *S*: Sample space
- $\mathcal{E}$ : Family of events  $E \subseteq S$  ( $\sigma$ -algebra in measure theory)
- $\mathbb{P}$ : probability  $\Rightarrow \mathbb{P}(E)$  is defined for all  $E \subseteq \mathcal{E}$  ( $\mu$  with  $\mu(S) = 1$ )

Example.

- 1. Toss a coin twice (H for Head, T for Tail) Then,  $S = \{HH, HT, TT, TT\}$
- 2. Uniform random variable in  $[0,1]^3$ Then,  $S=[0,1]^3$ . If  $E=[0,\frac{1}{2}]^3$ , then  $\mathbb{P}(E)=Vol(E)=\frac{1}{8}$

How to define  $\mathcal{E}$ ?

In example 2, let  $\mathcal{E}=$  family of all subsets of  $[0,1]^3$  naively. But Banach-Tarski Paradox says there are disjoint sets E,F with  $\mathbb{P}(E\cup F)\neq \mathbb{P}(E)+\mathbb{P}(F)$  in this  $\mathcal{E}$ . Therefore we cannot naively set  $\mathcal{E}$  (Use measure theory)

In example 1, suppose that we cannot see the second flip. If  $\{HH\} \notin \mathcal{E}$  and  $\{HT, HH\} \in \mathcal{E}$ , then  $\mathcal{E} = \{\phi, \{HH, HT\}, \{TH, TT\}, \{HH, HT, TH, TT\}\}$ 

#### **Definition 1.1** (Measure)

Let  $\Omega$  be non-empty set and  $\mathcal{F}$  be family of subsets of  $\Omega$  with

- 1.  $\phi \in \mathcal{F}$
- 2.  $A \in \mathcal{F} \Rightarrow A^{C} \in \mathcal{F}$
- 3.  $A_1, A_2, \dots \in \mathcal{F} \Rightarrow \bigcup_{i=1}^{\infty} A_i \in \mathcal{F}$ .

We say  $\mathcal{F}$  as  $\sigma$ -albegra or  $\sigma$ -field,  $A \subseteq \mathcal{F}$  as measurable, and  $\Omega$  as measurable space.

Exercises.

- 1)  $\Omega \in F$
- 2)  $A_1, A_2, \dots \in \mathcal{F}$ , then  $A_1 \cap A_2 \dots \in \mathcal{F}$
- 3)  $A_1, A_2, \dots \in A_n \in \mathcal{F}$ , then  $A_1 \cup \dots \cup A_n, A_1 \cap \dots \cap A_n \in \mathcal{F}$ .
- 4)  $A, B \in \mathcal{F}$ , then  $A B \in \mathcal{F}$

#### **Definition 1.2** (Topological Space)

(See Rudin: *Real and Complex Analysis, Chapter 1.*) Let  $\Theta$  be non-empty set and  $\tau$  be family of subsets of  $\Theta$  with

- 1.  $\phi, \Theta \in \tau$
- 2.  $V_1, \dots V_n \in \tau \Rightarrow V_1 \cap \dots \cap V_n \in \tau$
- 3.  $V_{\alpha} \in \tau \ \forall \alpha \in I \Rightarrow \bigcup_{\alpha \in I} V_{\alpha} \in \tau$ .

We say  $V \in \tau$  be open set, and  $(\Theta, \tau)$  be topological space.

#### **Definition 1.3** (Measurable Function)

$$f:(\Omega,\mathcal{F}) o (\Theta, au)$$
 is measurable if  $f^{-1}(V) \in \mathcal{F} \ \ orall V \in au$ 

#### **Definition 1.4** (Positive Measure)

Let  $\Omega$  be non-empty set and  $\mathcal{F}$  be  $\sigma$ -algebra. Then  $\mu: \mathcal{F} \to [0, \infty]$  is called **measurable** if

- 1.  $A_1, A_2, \cdots$ : disjoint members of  $\mathcal{F} \Rightarrow \mu(A_1 \cup A_2 \cup \cdots) = \sum_{i=1}^{\infty} \mu(A_i)$
- 2.  $\mu(A) < \infty$  for some  $A \in \mathcal{F}$ ,

and  $(\Omega, \mathcal{F}, \mu)$  is called **measrue space**.

**Definition 1.5** (probability space, random variable)

- 1.  $(\Omega, \mathcal{F}, \mathbb{P})$  is called as **probability space** if  $\mathbb{P}(\Omega) = 1$ .
- 2. *X* is called as **random varaible** if it is a function from  $(\Omega, \mathcal{F}, \mathbb{P})$  to  $\mathbb{R}$

#### Next Class

- Borel sets on  $\mathbb{R}$  or  $\mathbb{R}^d$
- Lebesgue Measure
- Lebesgue Integral (Define Expectation of random variable)

Last class, we define a sample space  $\Omega$ , a  $\sigma$ -algebra  $\mathcal{F}$ , and a (positive) measure  $\mu: \mathcal{F} \to [0, \infty]$ .

Exercises.

• 
$$A_1 \subseteq A_2 \subseteq \cdots \Rightarrow \mu(\bigcup_{i=1}^{\infty} A_i = \lim_{n \to \infty} \mu(A_n)$$

• 
$$A_1 \subseteq A_2 \subseteq \cdots$$
,  $\mu(A_1) < \infty \Rightarrow \mu(\bigcup_{i=1}^{\infty} A_i = \lim_{n \to \infty} \mu(A_n)$ 

#### **Theorem 1.6** (Rudin 1.10)

Let  $\mathcal{F}_0$  be a collection of subset of  $\Omega$ . Then,  $\exists ! \mathcal{F}^*$  minimal  $\sigma$ -algebra containing  $\mathcal{F}_0$ .

*Proof.* Let  $\{\mathcal{F}_{\alpha}, \alpha \in I\}$  be family of  $\sigma$ -algebra containing  $\mathcal{F}_0$ . Then,  $\mathcal{F}^* = \bigcap_{\alpha \in I} F_{\alpha}$  satisfies the three condition: 1) contain  $\mathcal{F}_0$  2)  $\sigma$ -algebra 3) minimal (trivial,  $\mathcal{F}^* \subseteq \mathcal{F}_{\alpha}$ )

#### **Definition 1.7** (Borel measurable)

 $\mathcal{B}$  is called a **Borel**  $\sigma$ -algebra on topological space  $(\Theta, \tau)$  if  $\mathcal{B}$  is minimal  $\sigma$ -algebra containing  $\tau$ , and  $\mathcal{B}$  is called **Borel measurable** if  $\mathcal{B} \in \mathcal{B}$ .

Remark (Completion of measure space, Rudin 1.15).

Consider an extension  $(\Omega, \mathcal{F}, \mu) \to (\Omega, \overline{\mathcal{F}}, \mu)$  where

1. 
$$\overline{\mathcal{F}} = \{A \cup N : A \in \mathcal{F}, N \subseteq A_0 \subseteq \mathcal{F}, \mu(A_0) = 0\}$$

2. 
$$\mu(A \cup N) = \mu(A)$$

Then, (Check!)

1. (well-definedness) 
$$A_1 \cup N_1 = A_2 \cup N_2 \Rightarrow \mu(A_1) = \mu(A_2)$$

2. 
$$\mu : \overline{\mathcal{F}}$$
 is  $\sigma$ -algebra.

3. 
$$\mu: \overline{\mathcal{F}} \to [0, \infty]$$
 is a measure

Example.

1) R

$$\mathcal{F}_{0} = \tau \xrightarrow{1.10} \mathcal{B} \xrightarrow{\text{completion}} \overline{\mathcal{B}}$$

$$\mathcal{L} \xrightarrow{\text{Rudin CH}_{2}} \mathcal{L} \xrightarrow{\text{completion}} \mathcal{L}$$

2)  $C[0,T] = \Omega = \{f; f : [0,T] \to \mathbb{R}, \text{continuous} \}.$  Define  $\mathcal{F}_0 = \{\bigcup_{t_1,t_2,\cdots,t_k} (A_1,A_2,\cdots,A_k) : 0 \le t_1 < t_2 < \cdots < t_k \le T; A_1,\cdots A_k \in \overline{\mathcal{B}} \}.$  We call  $\{f \in C[0,T] : f(t_1) \in A_1, f(t_2) \in A_2,\cdots,f(t_k) \in A_k \}$  as **cylindrical set**. Consider

$$\mathcal{F}_0 \stackrel{1.10}{\longrightarrow} \quad \mathcal{B} \stackrel{completion}{\longrightarrow} \quad \overline{\mathcal{B}}$$

$$\mathbb{P}_{BM} \stackrel{KET}{\longrightarrow} \quad \mathbb{P}_{BM} \stackrel{completion}{\longrightarrow} \quad \mathbb{P}_{BM}^*$$

(KET refers Kolmogorov's Extension Thm)

#### 1.2 Random Variables and Distributions

#### Definition 1.8

 $f: \Omega \to \mathbb{R}$  is measurable if  $f^{-1}(V) \in \mathcal{F}$  for any open set  $V \subseteq \mathbb{R}$ .

*Remark.*  $\mathcal{B}(\mathbb{R})$  = Borel  $\sigma$ -algebra in  $\mathbb{R}$ .

*Remark.* If f: measurable, then  $f^{-1}(B) \in \mathcal{F}$  for any  $B \in \mathcal{B}(\mathbb{R})$ .

*Proof.* Let  $G = \{A \subseteq \mathbb{R} : f^{-1}(A) \in \mathcal{F}\}$ . Then,  $\tau \subseteq G$ ,  $G : \sigma$ -algebra (check!), hence  $\mathcal{B}(\mathbb{R}) \subseteq G$ .

#### Definition 1.9

- $(\Omega, \mathcal{F}, \mathbb{P})$  is a probability space if  $(\mathbb{P}(\Omega) = 1)$ .
- *X* is **random variable** if  $X : \Omega \to \mathbb{R}$  is measruable.

#### Example.

1. Toss a coin Twice.

$$\Omega = \{HH, HT, TH, TT\}, \mathcal{F} = 2^{\Omega} = \{ \text{ all subsets of } \Omega \}, \mathbb{P}(A) = \frac{1}{4}|A|, \ A \in \mathcal{F}.$$
 Then,  $X = \#$  of H's is random variable with  $X(HH) = 2, X(HT) = X(TH) = 1, X(TT) = 1.$ 

2. Uniform random variable in [0,1]

$$\Omega = [0,1], \mathcal{F} = \{B \in \mathcal{B}(\mathbb{R}) : B \subseteq [0,1]\}, \mathbb{P}(B) = \mathcal{L}(B) \ (\mathbb{P}([0,1]) = \mathcal{L}([0,1]) = 1).$$
  
Then,  $X : [0,1] \to \mathbb{R}$  with  $X(x) = x$  be a (uniform) random variable in  $[0,1]$ .

Remark.  $\mathcal{L}$ : Lebesgue measure on  $\mathbb{R}$ . i.e.,  $\mathcal{L}(a,b)=b-a$ . Then, (a)=0  $(\because \{a\}=\bigcap_{i=1}^{\infty}(a-\frac{1}{n},a+\frac{1}{n})\Rightarrow \mathcal{L}(\{a\})=\lim_{n\to}\mathcal{L}((a-\frac{1}{n},a+\frac{1}{n}))=0)$  Similarly,  $\mathcal{L}([a,b])=\mathcal{L}([a,b))=\mathcal{L}((a,b])=b-a$ ,  $\mathcal{L}(\mathbb{Q})=\sum_{a\in\mathbb{Q}}\mathcal{L}(\{q\})=0$ .

Return to uniform random variable,

$$\mathbb{P}[X \in (a,b)] = \mathbb{P}[\{x : X(x) \in (a,b)\}] = \mathbb{P}[(a,b)] = b - a.$$

#### **Definition 1.10** (Distribution measure on *X*)

*X* is a random variable in  $(\Omega, \mathcal{F}, \mathbb{P})$ .  $\mu_X$  is a **distribution measure on** *X* if  $\mu_X$  is a probability measure on  $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$  such that

$$\mu_X(B) = \mathbb{P}[X \in B] \ \forall B \in \mathcal{B}(\mathbb{R}) = \mathbb{P}[\{\omega : X(\omega) \in B\}] = \mathbb{P}[X^{-1}(B)]$$

**Definition 1.11** (Probability density function)

*f* is a **probability density function** of *X* if 
$$\mu_X((a,b)) = \int_a^b f(x) dx$$

*Remark.* Radon-Nikodym-Lebesgue decomposition implies that any measure can be decomposed as density part and non-density part.

Example (Standard Normal random variable).

Let 
$$\phi(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$
. Define  $F: (0,1) \to \mathbb{R}$  by  $F(x) = N^{-1}(x)$  for  $N(X) = \int_{-\infty}^{x} \phi(y) dy$ .  
 Let  $\Omega = (0,1)$ ,  $\mathcal{F} = \{B \in \mathcal{B}(\mathbb{R}) : B \subseteq (0,1)\}$ ,  $\mathbb{P}(A) = \mathcal{L}(A) : A \in \mathcal{B}(\mathbb{R})$ .  
 Then,  $Y: \Omega \ni x \mapsto F(x) \in \mathbb{R}$  is a random variable with

$$\mathbb{P}[Y \in (a,b)] = \mathcal{P}[\{x : Y(x) \in (a,b)\}] 
= \mathbb{P}[\{x \in (N(a), N(b))\}] 
= N(b) - N(a) = \int_{a}^{b} \phi(x) dx,$$

and a density function is  $\phi$ .
